ASSIGNMENT - 17.1

2303A51945
B - 27

Task 1 – Customer Data Cleaning
Task:
Use AI to generate a Python script for cleaning a customer dataset.
Instructions:
• Handle missing values in columns (age, income, city).
• Remove duplicate records.
• Standardize text values (e.g., city names in lowercase).
• Encode categorical variables (gender, city).
Sample Code:

```
import pandas as pd
data = pd.read_csv("shopping_trends.csv")
print(data.head())
```

Dataset link:
https://www.kaggle.com/datasets/iamsouravbanerjee/customer-shopping-trends-dataset?select=shopping_trends.csv
Expected Output:
• A cleaned Pandas data frame ready for analysis

Prompt:
Generate a complete Python script for Google Colab that performs customer dataset cleaning according to these requirements:

Task – Customer Data Cleaning

Instructions:
• Download the dataset using kagglehub: iamsouravbanerjee/customer-shopping-trends-dataset
• Detect the correct CSV file inside the downloaded folder and load it with pandas.

• Clean the dataset with the following steps:
  – Handle missing values:
    * Age, Annual Income → fill with mean
    * Location → fill with mode
  – Remove duplicate rows
  – Standardize text columns (Location in lowercase)
  – Encode categorical variables:
    * Gender → label encoding
    * Location → one-hot encoding
• After cleaning, output:
  – DataFrame info before and after cleaning
  – First 10 rows of the cleaned DataFrame
  – Number of duplicates removed
  – Total missing values handled

Requirements:
• Use only the dataset loaded from kagglehub
• No manual file uploads
• Code only, no explanations
• All steps must run directly in Colab without modification

Produce only the complete Python script.

Code:

```
import pandas as pd
import os
from sklearn.preprocessing import LabelEncoder

# You already downloaded the dataset using kagglehub
# Now load the CSV directly from the downloaded folder
import kagglehub
path =
kagglehub.dataset_download("iamsouravbanerjee/customer-shopping-trends-dat
aset")
```

```python
print("Dataset path:", path)

# Find the CSV file inside the downloaded directory
csv_path = os.path.join(path, "shopping_trends.csv")

# Load the dataset
df = pd.read_csv(csv_path)
print("Dataset loaded from:", csv_path)

print("\n--- Initial DataFrame Info ---")
df.info()
print("\nInitial Head:")
print(df.head())

# ----------------------------------------------------------------
# CLEANING BEGINS
# ----------------------------------------------------------------

initial_rows = len(df)
initial_missing_values = df.isnull().sum().sum()

# 1. Handle missing values
numeric_cols = ["Age", "Annual Income"]
text_cols = ["Location"]

for col in numeric_cols:
    if col in df.columns:
        df[col] = df[col].fillna(df[col].mean())

for col in text_cols:
    if col in df.columns:
        df[col] = df[col].fillna(df[col].mode()[0])

# 2. Remove duplicates
before = len(df)
df = df.drop_duplicates()
removed_duplicates_count = before - len(df)

# 3. Standardize text columns
if "Location" in df.columns:
```

```
    df["Location"] = df["Location"].str.lower()

# 4. Encode categorical variables
# Label encode Gender
if "Gender" in df.columns:
    le = LabelEncoder()
    df["Gender_encoded"] = le.fit_transform(df["Gender"])

# One-hot encode Location (city)
if "Location" in df.columns:
    df = pd.get_dummies(df, columns=["Location"], prefix="city",
dtype=int)

# Stats after cleaning
final_missing_values = df.isnull().sum().sum()
removed_missing_values = initial_missing_values - final_missing_values

# ----------------------------------------------------------------
# OUTPUT
# ----------------------------------------------------------------
print("\n--- Cleaned DataFrame Info ---")
df.info()

print("\nFirst 10 rows:")
print(df.head(10))

print("\n--- Summary of Cleaning ---")
print(f"Initial rows: {initial_rows}")
print(f"Rows after duplicate removal: {len(df)}")
print(f"Duplicate records removed: {removed_duplicates_count}")
print(f"Missing values handled: {removed_missing_values}")

print("\nCleaned DataFrame ready for analysis.")
```

Output:

```
Using Colab cache for faster access to the 'customer-shopping-trends-dataset'
dataset.
Dataset path: /kaggle/input/customer-shopping-trends-dataset
```

```
Dataset loaded from:
/kaggle/input/customer-shopping-trends-dataset/shopping_trends.csv

Initial rows: 3900
Rows after duplicate removal: 3900
Duplicate records removed: 0
Missing values handled: 0

Cleaned DataFrame ready for analysis.
```

Task 2 – Sales Data Preprocessing
Task:
Preprocess sales transaction data using AI assistance.
Instructions:
• Convert date columns into datetime format.
• Create new features (month, year, day of week).
• Normalize sales amount column.
• Detect and handle outliers in dataset.
Sample Code:

```
import pandas as pd
data = pd.read_csv("sales_data.csv")
print(data.head())
```

Dataset link:
https://www.kaggle.com/datasets/vinothkannaece/sales-dataset?select=sales_data.csv
Expected Output:
• A transformed dataset with time-based features and normalized values

Prompt:
Generate a complete Python script for Google Colab that preprocesses a sales dataset using the following requirements:

Task – Sales Data Preprocessing

Instructions:
• Download the dataset using kagglehub: vinothkannaece/sales-dataset
• Detect the correct CSV file inside the downloaded folder and load it with pandas.

- Convert all date columns into datetime format.
- Create new time-based features:
  - Month
  - Year
  - Day of week
- Normalize the sales amount column.
- Detect outliers in the dataset and handle them appropriately.
- After preprocessing, output:
  - A summary of all transformations applied
  - The transformed DataFrame

Requirements:
- Script must run directly in Colab.
- Use only the dataset downloaded via kagglehub.
- Do not include explanations, only the complete Python code.

Code:

```
import pandas as pd
import os
import kagglehub
from sklearn.preprocessing import StandardScaler
import numpy as np

# --- 1. Download the dataset using kagglehub ---
dataset_name = "vinothkannaece/sales-dataset"
path = kagglehub.dataset_download(dataset_name)
print(f"Dataset downloaded to: {path}")

# --- 2. Detect the correct CSV file and load it ---
csv_files = [f for f in os.listdir(path) if f.endswith('.csv')]
df = pd.DataFrame()

if not csv_files:
    print("Error: No CSV file found in the downloaded dataset. Creating an
empty DataFrame.")
```

```
else:
    # Try to find a CSV with 'sales' in its name, otherwise pick the first
one
    main_csv_file = next((f for f in csv_files if 'sales' in f.lower()),
csv_files[0])
    csv_path = os.path.join(path, main_csv_file)
    print(f"Loading dataset from: {csv_path}")
    df = pd.read_csv(csv_path)

if df.empty:
    print("DataFrame is empty after attempting to load CSV. Aborting
further processing.")
else:

Output:

```
Using Colab cache for faster access to the
'sales-dataset' dataset.
Dataset downloaded to: /kaggle/input/sales-dataset
Loading dataset from:
/kaggle/input/sales-dataset/sales_data.csv
```

```
--- Summary of all transformations applied ---
- Created 'Month', 'Year', 'DayOfWeek' features from
'Sale_Date'.
- Converted column 'Sale_Date' to datetime format.
- Normalized column 'Sales_Amount' using
StandardScaler. New column:
'Sales_Amount_Normalized'.
- Handled 0 outliers in 'Sales_Amount' by capping
with IQR method. (Lower Bound: -4885.42, Upper
Bound: 14943.17)
- No duplicate rows found or removed.

Task 3 – Healthcare Data Preparation
Task:
Clean and preprocess a healthcare dataset using AI scripts.
Instructions:
• Handle missing values in blood_pressure, cholesterol.
• Encode categorical features
• Scale numerical features (min-max or standard scaling).
• Split dataset into training and testing sets.
Dataset link :
https://www.kaggle.com/datasets/abdallaahmed77/healthcare-risk-
factors-dataset
Expected Output:
• A preprocessed dataset ready for machine learning models.

Prompt:

Generate a complete Python script for Google Colab that prepares a healthcare dataset according to these requirements:

Task – Healthcare Data Preparation

Instructions:
• Download the dataset using kagglehub:
  abdallaahmed77/healthcare-risk-factors-dataset
• Detect and load the correct CSV file from the downloaded folder using pandas.
• Handle missing values in the following columns:
  – blood_pressure
  – cholesterol
• Encode categorical features in the dataset.
• Scale numerical features using either min-max scaling or standard scaling.
• Split the dataset into training and testing sets.
• After preprocessing, output:
  – A summary of all preprocessing steps
  – The final preprocessed dataset (features and labels)

Requirements:
• Use only the dataset obtained from kagglehub.
• Provide only Python code without explanations.
• The script should run directly in Colab with no additional modifications.

Code:

```
# ----------------------------------------------------
# Task 3 - Healthcare Data Preparation
```

```python
# ----------------------------------------------------

import pandas as pd
import numpy as np
import kagglehub
import os
from sklearn.preprocessing import LabelEncoder, MinMaxScaler,
StandardScaler
from sklearn.model_selection import train_test_split

# Download dataset
path =
kagglehub.dataset_download("abdallaahmed77/healthcare-risk-factors-dataset
")
print("Dataset path:", path)

# Detect CSV file
csv_file = None
for f in os.listdir(path):
    if f.endswith(".csv"):
        csv_file = os.path.join(path, f)

df = pd.read_csv(csv_file)
print("\nLoaded dataset from:", csv_file)

print("\n--- Initial Data Info ---")
df.info()
print(df.head())

# Store initial info
initial_missing = df.isnull().sum().sum()

# Handle missing values
for col in ["blood_pressure", "cholesterol"]:
    if col in df.columns:
        if df[col].dtype != "object":
            df[col] = df[col].fillna(df[col].mean())
        else:
            df[col] = df[col].fillna(df[col].mode()[0])
```

```
# Encode categorical features
for col in df.select_dtypes(include="object").columns:
    le = LabelEncoder()
    df[col] = le.fit_transform(df[col])

# Scale numerical features
numeric_cols = df.select_dtypes(include=["int64", "float64"]).columns

scaler = MinMaxScaler()
df[numeric_cols] = scaler.fit_transform(df[numeric_cols])

# Split dataset
X = df.drop(df.columns[-1], axis=1)   # assume last col is target (dataset
design)
y = df[df.columns[-1]]

X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,
random_state=42)

# Output
print("\n--- Summary ---")
print("Initial missing values:", initial_missing)
print("Missing values after cleaning:", df.isnull().sum().sum())
print("Training set shape:", X_train.shape)
print("Testing set shape:", X_test.shape)

print("\n--- Preprocessed DataFrame ---")
df
```

Task 4 – Employee Salary Data Preprocessing

Task:

Clean and preprocess an employee salary dataset using AI scripts.

Instructions:

• Handle missing values

• Detect and remove salary outliers.

• Standardize department names (lowercase).

• Apply label encoding to job location, department.

Dataset link:

https://www.kaggle.com/code/vishantmathur/employee-salary
Expected Output:
• A structured dataset ready for HR analytics.

Prompt:
Generate a complete Python script for Google Colab that preprocesses an employee salary dataset according to the following requirements:

Task – Employee Salary Data Preprocessing

Instructions:
• Download the dataset using kagglehub: vishantmathur/employee-salary
• Detect and load the correct CSV file from the downloaded folder using pandas.
• Handle missing values in the dataset.
• Detect salary outliers and remove them from the data.
• Standardize the department names by converting them to lowercase.
• Apply label encoding to the following categorical columns:
  – job location
  – department
• After preprocessing, output:
  – A summary of all the preprocessing operations performed
  – The final cleaned and structured dataset

Requirements:
• Use only the dataset downloaded via kagglehub.
• Output only the Python code with no explanations.

• The script must run directly in Google Colab without modifications.

Code:

```
# ------------------------------------------------------------------
# Task 4 – Employee Salary Data Preprocessing
# ------------------------------------------------------------------

import pandas as pd
import numpy as np
import kagglehub
import os
from sklearn.preprocessing import LabelEncoder

# Download dataset
path = kagglehub.dataset_download("vishantmathur/employee-salary")
print("Dataset path:", path)

# Detect CSV file
csv_file = None
for f in os.listdir(path):
    if f.endswith(".csv"):
        csv_file = os.path.join(path, f)

df = pd.read_csv(csv_file)
print("\nLoaded dataset from:", csv_file)

print("\n--- Initial Data Info ---")
df.info()
print(df.head())

# Store initial missing count
initial_missing = df.isnull().sum().sum()

# Handle missing values
df = df.fillna(df.mode().iloc[0])    # safe generic fill

# Detect & remove salary outliers
if "Salary" in df.columns:
```

```
    Q1 = df["Salary"].quantile(0.25)
    Q3 = df["Salary"].quantile(0.75)
    IQR = Q3 - Q1
    lower = Q1 - 1.5 * IQR
    upper = Q3 + 1.5 * IQR
    df = df[(df["Salary"] >= lower) & (df["Salary"] <= upper)]

# Standardize department names
if "department" in df.columns:
    df["department"] = df["department"].str.lower()

# Label encode job location & department
for col in ["job_location", "department"]:
    if col in df.columns:
        le = LabelEncoder()
        df[col] = le.fit_transform(df[col])

# Output
print("\n--- Summary ---")
print("Initial missing values:", initial_missing)
print("Missing values after cleaning:", df.isnull().sum().sum())
print("Dataset shape after removing outliers:", df.shape)

print("\n--- Final Preprocessed DataFrame ---")
df
```

Output:

```
$ python preprocess_salary.py
